

PDM 3.0 OVERVIEW

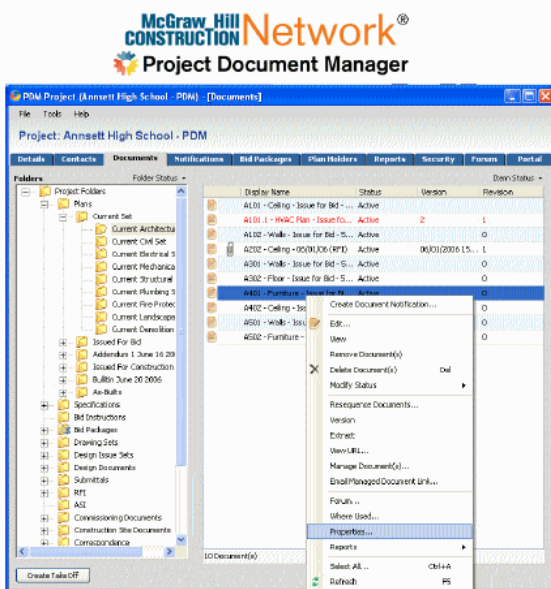

PDM is a document management solution tailored for the AEC industry and enables the user to take control of the thousands of documents generated from the design & development phase to close out – all on a secure desktop application. The system is designed to make sure all documents are efficiently captured, organized, distributed and archived for the life of the building. PDM is designed to foster rapid, efficient and accountable communication between Owners, Architects, General Contractors, Subcontractors and Construction Support channels throughout the life of your project.

PDM is a Windows Remote Application. It runs on the local computer as a native windows application, but connects to a remote web server for services and data. This provides the rich user interface of a windows application with the easy deployment and maintenance of a web application.

PDM allows you to manage the way you communicate with other people on the project and how you store, access, and distribute documents. It contains tools that allow you to manage your documents, bid packages, contacts, notifications, reports and many other things related to your project.

PDM Features:

- Central document storage and archive with complete version control
- View and order documents online
- Automated notification and invitation to bid system
- Online instant printing and online takeoffs
- Integration with McGraw-Hill to push or pull project content

- Document Management
- Document Controls
- Design Collaboration
- Automatic Version Control
- Multiple Formats
- Complete History
- Bid Management
- Contact Management
- Pre-Qualification
- RFI and Submittal Management
- Project Management, Estimating and Accounting Integration
- Electronic Closeout
- Simple interface for Subcontractors and Vendors...
